Fukushima radioactivity in the Pacific—facts and public anxiety

My talk will review field work and experimental studies regarding the radioactive contamination in water, sediments, and fish following the damage to the nuclear power plant at Fukushima, Japan. The talk will consider the biogeochemical cycling of Cs radioisotopes, their bioaccumulation and radiological doses in marine animals, and the likely doses and risks to human seafood consumers. The talk will also consider my perspective on the public's reaction to these findings.

Host: Frank Bohlen

Time & Date: 11:00 am, Friday, October 6, 2017

Place: Marine Sciences Building, Seminar Room 103
